

Chronis – Behavioral Analytics Platform

Hackathon Submission – Task C: End-to-End User Experience Prototype

1. Title Page

Project Title: Chronis – Behavioral Analytics Platform

Developer: Palash Rai

College: Madhav Institute of Technology & Science, Gwalior

LinkedIn: <https://linkedin.com/in/palash-rai2612>

GitHub: <https://github.com/Palash-r26>

2. Project Overview

What Problem Does it Solve?

Tracking personal habits like **sleep, screen time, deep work, and exercise** is often fragmented across multiple apps. Users struggle to see how these metrics interact (e.g., how screen time impacts sleep and ultimately deep work). This lack of unified data prevents users from making meaningful behavioral improvements.

Why is it Important?

In an increasingly distracted world, **optimizing personal productivity and mental health** requires holistic data. A unified telemetry dashboard allows individuals to understand the direct consequences of their daily routines, empowering them to build healthier, more effective lifestyles.

High-Level Solution

Chronis is an advanced behavioral analytics platform that synthesizes raw daily metrics into a single, highly visual dashboard. It leverages **AI-driven insights** to discover hidden correlations between habits and productivity, providing automated coaching and actionable blueprints for self-improvement.

3. Task C – User Experience Prototype

The core focus of Chronis is delivering an **intuitive, visually striking, and frictionless user experience**.

Step-by-Step User Flow

1. **Onboarding & Landing:** Users are introduced to the platform's value proposition via a clean, modern landing page featuring micro-animations.
2. **Authentication:** A sleek login/registration portal with integrated demo-user access for seamless testing.
3. **The Dashboard:** The primary telemetry hub where users can visualize their aggregated behavioral data.
4. **Insights Explorer:** Users dive deeper into AI-generated insights, discovering correlations between their screen time and sleep.
5. **Admin Portal:** Administrators have a dedicated bird's-eye view to manage users and monitor platform-wide telemetry.

[Insert Screenshot Here – Admin Management Portal]

Caption: The Admin Dashboard providing a scalable view of all registered users and their linked data.

4. Architecture / Flow Diagram

The system is designed with a clean separation of concerns, ensuring high performance and scalability.

```
graph TD
    A[User / Web Browser] -->|HTTP / REST API| B(FastAPI Backend)
    B -->|Authentication| C{JWT Security}
    C -->|Read/Write Data| D[(PostgreSQL Database)]
    D -->|Return Behavioral Data| B
    B -->|JSON Response| A
```

Caption: Simple, clean data flow from the client interface to the secure backend database.

5. Tech Stack

Chronis is built on a robust, modern technology stack:

- **Frontend:** React, Vite, Tailwind CSS (for rapid, responsive UI), Framer Motion (for smooth micro-animations), Recharts (for data visualization), Lucide React (for iconography).
 - **Backend:** Python, FastAPI (for high-performance API routing), SQLAlchemy (ORM), Pydantic (data validation).
 - **Database:** PostgreSQL.
 - **Security & Tooling:** JWT (JSON Web Tokens) for secure session management, Bcrypt for password hashing.
-

6. Key Highlights

What Makes this Project Unique?

- **Premium Aesthetic UI:** A distinct visual identity prioritizing rounded glassmorphism elements, micro-animations, and a highly polished dark/light mode integration.
- **Unified Telemetry:** Instead of tracking just one metric, Chronis correlates diverse data points to offer holistic insights.
- **Frictionless Demo Testing:** Built-in demo accounts allow judges and testers to bypass registration and instantly experience the dashboard.

Scalability / Real-World Usage

- The **FastAPI + PostgreSQL** architecture ensures the backend can seamlessly handle thousands of concurrent users.
- The **Role-Based Access Control (RBAC)** system allows the platform to scale into enterprise or educational environments where administrators can monitor group metrics.

7. Conclusion

What I Learned

Building Chronis provided deep hands-on experience in **full-stack system architecture**. I learned how to securely manage authentication states using JWTs, design fluid and responsive user interfaces with Tailwind CSS and Framer Motion, and architect a robust RESTful API capable of processing complex relational data.

Future Improvements

- **AI Integration:** Implementing an active Machine Learning model to auto-generate personalized daily schedules based on historical data.
- **Mobile Application:** Porting the responsive web experience into a native React Native mobile app for on-the-go tracking.
- **Wearable Sync:** Direct API integrations with Apple Health and Google Fit to automate the collection of sleep and exercise data.
